

# Math For Fun Vol 3: 61 Amazing Math Games collection, Cool Math Games for Kids (Math Games Ideas)

Statistics show that over the summer break, most students lose an average of two to three months of math computational skills they learned during the previous school year. This loss of learning can mean an academic setback for some children that can take weeks, and in some cases months, to remedy when the school bells ring in the fall. We all know that children enjoy playing games. Experience tells us that games can be very productive learning activities. But ... What should teachers say when asked to educationally justify the use of games in mathematics lessons? Are some games better than others? What educational benefits are there to be gained from games What is a mathematical game?

When considering the use of games for teaching mathematics, educators should distinguish between an activity and a game. Gough (1999) states that A game needs to have two or more players, who take turns, each competing to achieve a winning situation of some kind, each able to exercise some choice about how to move at any time through the playing. The key idea in this statement is that of choice. In this sense, something like Snakes and Ladders is NOT a game because winning relies totally on chance. The players make no decisions, nor do that have to think further than counting. There is also no interaction between players - nothing that one player does affects other players turns in any way.

Oldfield (1991) says that mathematical games are activities which: involve a challenge, usually against one or more opponents; are governed by a set of rules and have a clear underlying structure; normally have a distinct finishing point; have specific mathematical cognitive objectives. Benefits of Math Games: The advantages of using games in a mathematical programme have been summarised in an article by Davies (1995) who researched the literature available at the time. Meaningful situations - for the

application of mathematical skills are created by games

Motivation - children freely choose to participate and enjoy playing

Positive attitude - Games provide opportunities for building self-concept and developing positive attitudes towards mathematics, through reducing the fear of failure and error;

Increased learning - in comparison to more formal activities, greater learning can occur through games due to the increased interaction between children, opportunities to test intuitive ideas and problem solving strategies

Different levels - Games can allow children to operate at different levels of thinking and to learn from each other. In a group of children playing a game, one child might be encountering a concept for the first time, another may be developing his/her understanding of the concept, a third consolidating previously learned concepts

Assessment - childrens thinking often becomes apparent through the actions and decisions they make during a game, so the teacher has the opportunity to carry out diagnosis and assessment of learning in a non-threatening situation

Home and school - Games provide hands-on interactive tasks for both school and home

Independence - Children can work independently of the teacher. The rules of the game and the childrens motivation usually keep them on task. Few language barriers - an additional benefit becomes evident when children from non-english-speaking backgrounds are involved. The basic structures of some games are common to many cultures, and the procedures of simple games can be quickly learned through observation. Children who are reluctant to participate in other mathematical activities because of language barriers will often join in a game, and so gain access to the mathematical learning as well as engage in structured social interaction.

Math For Fun Vol 3: Math Games Ideas is the volume 3 of Math For Fun Series. This book series has 4 volume. It is a book of 61 unique amazing cool math games collection. Kids will love the games.
