# Growing up with Technology: Young childrens computer use and their self- esteem

Childrens fascination with computers and simultaneously the lack of empirical research around the connections of computer use with young childrens emotional and self-development is the focus of this book. A quasi-experimental study, aimed at investigating young childrens computer use in association with their self-esteem is discussed. Tests with 52 children (4-6 years old), questionnaires with parents, interviews with teachers, and the seven month intervention are presented in detail. Results revealed significant increases of self-esteem for children in the intervention group. Positive attitudes towards young childrens computer use by all participants were identified. Additionally, young children appeared to have accurately assessed their self-esteem when their assessments were compared with those completed by teachers and parents. The findings suggest that when computers are used in an integrated, developmentally appropriate way, there are positive relationships with childrens self-esteem. Implications and recommendations for early childhood policy makers, researchers, teachers and parents are also identified.
